

Speaker 1 01:06

Hanging out, getting all the crap that's up here.

Yeah, yeah, yeah.

Okay, so as you see the word? We're getting rid of this. Dude, a new cashew yesterday. Right now, where you said?

I got some good news. I hope it's good news.

Speaker 2 02:11

Real-Time insurance is go September 20, release you all. Let's go ahead and start planning to build out staging. Let's go ahead and plan to build out production. I was asking.

Speaker 3 02:29

Who can we get to build these things out? Because if Psy and Alex and CG are the only people that ever build stuff? I've never single thread. So, what I would suggest you all do is, do you all want to get in the room with Mike and John Brawl stand up staging and then say you all are doing production, or do you want to do?

Speaker 4 02:47

Yeah, I mean, I think that that's great. I just that this September release is super soon, and I think we should make a best effort, but we also should not sacrifice timelines or efficiencies because it's just not worth it,

Speaker 3 03:00

Uh, two weeks to do it. I mean, and I would say the very next database. I've heard of anybody setting up databases, but you? I think we're okay on lambdas and everything else, but I'm mostly worried. Like, can we get on? Offer, you know. Can we get any JDS can anybody to set up at that place and sites?

Speaker 5 03:21

So, I did speak to JVS before. It's an insane, okay, because he's the one that's going to be holding, um, okay. So, I signed that ticket to Danny, so I should reassign it to JBS. I think it's, I think, any computer science you join me this awesome?

Speaker 3 03:40

That's unique. So then I'm starting to feel better, but I would say, at a minimum, we need to have Mike and John brawl

Speaker 4 03:47

In the room with people. That's really cool, but I mean, we don't even know, like, where we're putting the staging environment like, we don't know what account this of. And like, I, I just, I don't. I think I mean, two weeks is plenty of time, instead of two environments for this type of thing.

But it's also like there is probably like. A good amount of time in for whoever does it, and I think that. Yeah, like, we should work on on upscaling, others, and stuff like that. But, um. I don't

know, like? Hour, like our runbook Library, like isn't where it should be either.

And maybe that's like the first way we should address this, but like? Okay. My exact point. But yeah, and so you're gonna have to just pick even if it's not ideal a existing account. You're not going to create another account already. Um, I, I would suggest we should, but we don't have to.

I don't think you're going to get an answer.

Speaker 3 04:48

People ought to agree that we're going to need to create another account in 2 weeks unless you really think we can.

Speaker 4 04:55

I mean to get people to agree, I could create account in 5 minutes. But no, I, I think it might be

Speaker 1 04:59

More trouble as far as I don't know that right on so well, I just wanted to get that in your head. You got a 3-day weekend?

Speaker 4 05:09

We really enjoyed staging environment for this, uh,

Speaker 3 05:11

If you all want to talk to Shiva and to Larry Schuler and say, we're not going to do it, and they say that's fine then. Great, but I have a feeling they're going to say pretty please. Can we do it? So, for the present mapping, uh, it says L2 port, right?

For the staging.

Speaker 1 05:28

Yeah, what? What mapping do you the one, uh, that we have, like, right now? What we have, but the existing mappings like environment mappings. What I observed is like.

Speaker 6 05:43

Uh, for the staging, it says L2 Pro prep, sorry.

Speaker 5 05:47

Whatever mapping says that is incorrect, that is absolutely not. I think he just corrected himself. L2 prep.

Speaker 1 05:52

Yeah,

Speaker 7 05:53

Yeah, that

Speaker 3 05:53

Is awesome. That is also incorrect, though. I mean, preprod is intended to be a a designation for

prod data, and we don't do raw data and staging.

Speaker 5 06:02

Uh, so it's a pure miscategorization. I mean, I think I think of anything what we have. We should do L2 uat.

Speaker 4 06:09

I think I think, to be honest, intuitively LTP product makes the most sense because it is, like, the last environment we go to before prod, and I completely see why you say that, but

Speaker 1 06:17

It's like such

Speaker 4 06:18

A delineation from what the entire purpose of non-profit versus pre-product is an L1 and L1. Staging is non-fraudulent. Guidewire staging is non-prod. I think we need to put it in a non-credit account. I think it's really sucky that we do not have an account for it. I think the fact that we would have trouble committing people we need.

The account is sucky, and it should be. Hey csgrt, we really need to do this. And they say, go ahead and do it. That's all it should be. Um, I. I don't know, like? I think they might say, well, what's your strategy overall, and we'll say we'll get that to you, but we're supporting this release for this extremely important and extremely time, sensitive project could also just

Speaker 3 07:02

Put it into whatever account is the next best option, and then move it later. Yeah, that's

Speaker 1 07:07

True.

Speaker 4 07:07

I mean, it's just like we always, it's just it's kicking the can down the road with a crappy solution, and we always do that, and we end up with more and more cleanup work. And it's like we could just create the right account. The great account. It all does not take long, and it's just like.

Arguing in bureaucraties. That would be the blocker.

Speaker 1 07:26

So, who

Speaker 3 07:27

All needs to agree

Speaker 4 07:28

For CSGT and then us, but I think we can agree quickly. So, I mean, should

Speaker 3 07:33

People want to do that like, tomorrow, like, have, I don't know if you've had a chance to stand up

a ticket, but maybe you just started an email saying, hey, everybody, unless you say otherwise, we're creating another account by this name. I did say. To say, let's go ahead and review his document that's produced to see what he's even going to csgt to present as his suggestion for account long-term

Speaker 4 07:56

Account structure. I didn't know you finished that. So, yeah, we should definitely do that.

Speaker 1 07:59

Yep, before we get

Speaker 3 08:00

Into all that, was there any other topics we want to talk about? And I just wanted on the company, um. Or where the environment, priorities, and guidewires? There's non-fraud pre-prod and prod solar systems everything.

Speaker 4 08:17

So, prod is a product. That's it free. Prod has MPT and Perth, and that's it. Went dry run, but we don't have an equivalent for kfbs or anything that's just a guide. Wire thing and then non-prod is everything else. So, uh, Dev2, keyway qa2, staging uat1, uh2, bubble cocoa.

It's just that I don't think that we have a good account option. That's not like crazy. Confusing, and that would not beg the question. Why did they ever put it here if it lives there for any more than like a month, it's like whoever comes and finds it would be like, why would it be here?

We don't have an option that isn't

Speaker 3 08:57

Like that right now, which is crappy, so. Yeah, I just think if you tried a strong arm, a team of people that have a pretty methodical, slow process of thinking. I think you're just gonna find out you wasted your breath, and you're just going to put it in the wrong place anyway, but?

Give it a shot. Let's see what happens. Yeah, I mean. That's cool.

Speaker 1 09:23

Unless you can sneak around their backs, sometimes ask for forgiveness.

Speaker 3 09:27

Yeah, I mean the only person we would need to be convinced is Jackson and Matt, really. But I don't know, like?

Um. Anything else we want to talk about before? We just jump into this document.

Speaker 1 09:46

No, no,

Speaker 3 09:46

Okay, yeah. So, September 20th is when they are going live with real-time insurance. I don't

know if everybody's shared or heard, but performance working or existed pretty nicely is what I heard. Yes, and I don't know where it's involved or what they did, but they were happy. Okay, um, because I'm in the middle of?

Trying to troubleshoot before Aaron and proof with Rejoice because? He's unable to load. Um. His work, the work from down the stage two space.

What were they performance testing? Do you know

Speaker 7 10:25

I'm not sure, but uh, all I got from Zach is, uh, it's good. And it, it got what they need, all right calls or something, and

Speaker 4 10:34

So, this is

Speaker 2 10:34

The big initial policy working for dinner policy Center

Speaker 5 10:38

Inserts data, though, right. So,

Speaker 1 10:41

I mean,

Speaker 5 10:41

They're probably performance test data insertions, and in fact, there wasn't some huge load or whatever it fetch.

Speaker 3 10:49

Like, I would assume like the biggest thing we're concerned about is how fast we can catch records out of this thing is a few seconds. I I, I'm sorry, I should probably know more, but I don't know more, but the fact that you tell me that we did a load on a system that was almost anything, tells me this was a pretty useless formulas test.

I'm assuming that load is going to have millions of records in the database, so they just tested an empty database, which always performed wonderfully.

Speaker 1 11:16

And then you load it and wonder why

Speaker 2 11:19

We need to load it and index it and reordinate sure. Then let's so. How about do we? We don't have a real tile.

Speaker 3 11:30

Nope.

Okay, so very shoulder. There's no longer responsible for this stuff, but he's selecting. Butter back, who is responsible?

Make sure I get the right side. Nope, I clicked the wrong side. No.

Because it's a wonderful name, right? Uh, who else wants to be here?

Uh, Rajesh. Yes, for sure.

Speaker 1 12:21

Um. Exactly, getting involved. Yeah, you already. Have you got Zach? I did. I was looking for him. Oh, he's over there. Alex always wants to be there. It's an Alex. Let's stop checking.

All right.

I guess

Speaker 6 12:51

We have to use L2 uat if we really are going to use the existing accounts. I don't know what else to make more sense. I agree with you. But it's like. You expected to be uat lyrics?

Speaker 1 13:13

Yeah,

Speaker 8 13:13

Utility doesn't have any, uh, production data, right?

Speaker 4 13:16

So, I mean, it's, I think it's better than pre-prod for that reason. Yeah, because, like I.T security like really cares about that hard line, and it's like we fought. We do a good job following it everywhere else, but I guess, I guess that's the? I think that's the type of solution Philip is encouraging us to take for now, and

Speaker 7 13:35

I, I

Speaker 4 13:36

Guess it's not a big deal. It really isn't. I'm making a bigger deal about it than I think it really is. We could use LCD UAT.

Speaker 3 13:42

I appreciate how passionate you are, and

Speaker 1 13:44

The world is left and soured, and I'm just trying to temper you to disappoint. We can get it.

We got a chat going. Let's see if we can keep it going. But it's a go.

Speaker 3 14:03

Once the button, it says, save this to my favorites, my favorites. Y'all got your favorites! Good up here. All right. No, you gave us a simple document to read, right? Sorry, not too much. AI,

Speaker 7 14:21

Um, not too much. Actually, just three pages and. That sounds nice.

Speaker 3 14:32

Evaluate existing AWS accounts, by the way, where any of you all. I don't think everybody in this room was in the meeting, where we had AWS on the phone trying to explain to managers how security works. Uh, some management. A some managers are asking for team-based security of the cloud, like searching once only her team to have access to some stuff, and we're trying to talk her out of it.

And remember, he's jumping on, saying, well, Mike, can you give any more access to this, and I'm like, are we just going to carry all the team-based security into the cloud? Is that what you're asking for. So, we asked AWS to show up and explain to them how it's supposed to be done.

And one of the first things I talked about was doing micro accounts. Yeah, I mean, that's

Speaker 5 15:14

My immediate reaction. That's the only one that was the only reasonable way to do that, like, it's like, you can't. It, you don't want to do it any other way. That's that would be how you do it

Speaker 2 15:23

Right back where we started with. This Mainframe environment belongs to this team. Yeah,

Speaker 1 15:27

And they

Speaker 4 15:28

Have access to everything and everyone else is, I

Speaker 6 15:31

Guess, my question is, like, it's like, it's like, what you always talk about. It's like, when somebody needs access, and then they ask for it, we always give it to them. And it's like, why, what are we accomplishing? No, I think. I don't know where it was coming from.

Cerucci's probably just old mindset.

Speaker 3 15:48

Coming into the new world, saying, I want my team to have access to it. No, everybody has access, or nobody has access to security. We just got to convince her that it's okay. Sometimes, it's hard to change, but it's not walking this work. Yeah, funny story inappropriate. A funny story I'm watching Santa Clarita's diet.

I love that show on Netflix, Santa Clarita's diet.

Speaker 1 16:11

I gave him Netflix. It costs too much. Drew Barrymore, Timothy Oliphant. It's in a future where there are zombies. She turns into a zombie.

Speaker 3 16:23

And, uh, anyway, lose interest in that, but I remember this scene because this was like four or five years ago. There's a scene where Timothy Allen hunts in the basement trying to get over the fact that his wife is now become a zombie, and he's smoking a joint. Kind of, oh, he's being a bad boy.

He's smoking weed, and then a cop. His neighbor's a cop sits down with him

Speaker 2 16:40

To smoke with him, and they're sharing a, you know,

Speaker 3 16:43

And I'm, like, oh, he's a bad cop. He's smoking weed, and then the next thing I realized, oh we, people in California. My brain is so used to seeing like marijuana is illegal. If a cop's smoking, it? They're a bad cop. But then, I'm like, California, it's legal man.

That's just what happens now. Legal. A lot of places now, so I'm just trying to. My brain grew up for years. Weed dare, don't do it. That cop, I think, your pizza. He's probably just. Searches I've used to seeing this monthly. Yeah, don't you all love that. I bring these things in.

Speaker 1 17:21

Yeah, you're really. You really brought the illusion to life fans. That's good. Yeah.

Drug test online. I don't know. It was just a funny thought like I did go through my brain. Like, oh my gosh, why did I think that was so bad it was? My brain's just so used to sitting that.

I've just appointed Alex and now Mike. Mike Martinez was disappointed now at this point now.

Speaker 3 17:58

All right. So, is it down here? I'll zoom in. Let's read and hang on is everywhere. Can we have an AI Mary in your voice? Let me get 11 Labs gone.

My laptops. What's going on?

Whatever.

All right. Evaluate existing AWS accounts estate estate. That was it?

Speaker 1 18:49

It's in a state. It's multiple accounts coming together to make kfb's footprint right. Determine

Speaker 3 19:02

How accounts map to and and determining how accounts matter to kfb environment need. There is no single aw's account for each environment. So, that's one thing you're deciding.

We're not going to have one-to-one parody.

Speaker 1 19:14

Yeah, the correct account depends

Speaker 3 19:16

On the kfb environment, such as uat per for production.

Speaker 4 19:21

That doesn't necessarily try to make a policy on where in, for example, L2. We're going to have one-to-one parody. It's saying there are there are different levels of accounts and a given environment might span multiple accounts. Because of that, I think.

Speaker 3 19:35

It also depends on whether the application is L1, RL2, L1 Legacy, or migrated applications that use additional compute based Services. L2 Cloud native applications deployed managed through infrastructure as code. For example, perf uses pre-production for L1 and L2 pre-product for L2. So, pre-production is the L1. Yeah, L2 is explicitly named.

So, here's your map. Yeah, this is what I observed, actually. Uh, the existing one?

Speaker 4 20:11

These are the L1 accounts technically non-production of pre-production. There's no hyphen, no nothing. But it doesn't matter. I knew what you meant.

Speaker 3 20:23

Yeah, I think so. If I remember, right?

Speaker 4 20:29

Oh, no size, right? Ignore me, I'm Batman. So, Dev, I don't even think it's called Dev1, though, is it, is it just called Dev? Yeah, so it's Dev maps.

Speaker 3 20:40

There there. Q a q a q a q a qat1 uat2 would go to UAG. Yeah, I'm also only worried about L2 unless you are telling me, which is cool. Yeah, uh. So this is the one thing you were having a problem with. So, yeah, because?

Speaker 4 21:01

I mean, I think the intuitively it makes sense, but it's like it. It misaligns too much well, but also it's incorrect for L1. L1 is 100%. We have it in non-production.

Speaker 3 21:11

Oh, you have known production for staging.

Speaker 4 21:12

Yes, and I mean, I think we need to do. I think L2, uat, or l2qa or create L2 staging. I mean. Especially if we're not trying to propose a different structure right now. I think csgt would get on board if we say, hey, we're going to keep this structure, and we're going to add L2 staging

because we don't feel like it fits in the buckets we have.

I think they could be cool with that. I don't like, I don't think it's like. I think that's a reasonable solution. I don't think it's perfect, but I think we kind of. Started doing it this way, and I don't think it's horrible, I mean. Like? We know what our two pre-prod regions are.

We don't have a lot of them. I think we know that if we know that they go to L2 pre-prod, that's okay. Um, I think. Qa having QA and QA2 is intuitive enough. I think uat having uat 1 and 2 is intuitive enough in Dev, having Dev and dev2 is intuitive enough.

I think the only thing we really it's like, I feel like staging also deserves its own account almost to an extent, and I think it's the only one that doesn't have, like, a, we're gonna keep what we have at least. Mostly. I think that's the one place we we should like, bolster it.

Kind of. So right now, what are we using?

Speaker 5 22:27

Like u84. Like, any certain

Speaker 4 22:30

Purpose, uh, so we have a uat one and uat2 environments like they're they're very actively used environments uat2, more so than uac one, but it's just we don't have any L2 workloads for those yet. Okay, I mean, like?

Speaker 3 22:45

Almost

Speaker 7 22:45

Sorry.

Speaker 3 22:45

No, I was like trying to wait. I was trying to get in right as you were done.

Speaker 4 22:48

Almost every main kfb app has both of those, like uat environments like arms or cash receipts like the or like the centers, like the big ones will always have those environments, So eventually we'll get those okay, uh, uh.

Speaker 5 23:00

So right now, we are not using that for anything. Yeah,

Speaker 4 23:03

They requested it for real time, but real time's really. The only thing we're deploying in L2 right now, so if real time hasn't gone there, we like, don't do it. Okay, much.

Speaker 3 23:13

You're gonna have cash receipts replacement mortgagey list coming at you.

Speaker 4 23:17

True, I guess she's starting to get more stuff into debt now, too.

Speaker 3 23:20

Oh, and you really shouldn't have, like all the other things we did, right, like the claim mobile upload. That's all I want because we

Speaker 4 23:27

Deployed it on our existing patterns. Okay, I

Speaker 1 23:30

Mean,

Speaker 4 23:30

There's nothing different about that than any of the other Tomcat applications we run outside of the fact that it's deployed via Cic and the mobile upload claims mobile up mobile upload is n1. It's.

Speaker 3 23:42

That's fine. It's an

Speaker 4 23:43

Anomaly, I mean, but that's been.

Speaker 5 23:44

Yeah, it's built.

Speaker 4 23:45

That's totally a different way. That's been how it is since before Tyler

Speaker 1 23:49

Left, so

Speaker 4 23:49

I, I don't,

Speaker 3 23:50

So real-time insurance is really the first pay, uh, workload coming through the L2. Yeah, technically.

Speaker 4 23:57

Typically, JBS has a Lambda that ran, and that's the only reason the L2 prod, like networking's, even set up. But that's it there. And, and retroactively, it was like stated, we shouldn't have put that in L2. And it's, it'll stay there. But going forward, we have more stranger requirements, and there'll be more discussion around these things.

When we take something there, which is, we saw that with real time. Gosh.

Speaker 3 24:28

I didn't know if he was asking. I think I get what he was asking, but I didn't know if he was asking, what are we as a company using uat2 for except what this represents? It's like the same thing as a QA environment for us. If you don't,

Speaker 1 24:40

It's an additional,

Speaker 3 24:40

Yeah,

Speaker 2 24:41

So that when we run our test batch cycles, they have to lock down the environment. And so it gives the testing people

Speaker 3 24:50

Different place to test for today. While that's going on, and then, when that's done, they'll swap, and they're back and.

Speaker 4 24:58

Thanks very much for most of the evening project, like qa2 and u82. Like, we're for exactly that, like qa2 would be running bash at one time, and then all testers would be in uat2 and they'd flop them

Speaker 3 25:07

To keep everything moving. Yeah, ut1 is for training. Although I don't know why, they don't really put that in here. Staging is just where we're going to go right now. It's our production support region. Kind of. But, uh, that's kind of true. It's also the last step here I go to, but anyway, that I think I was starting to update this document, and I'm assuming you gave me a link and not an ad copy.

How do I know where this darn document lives? Make sure it's not

Speaker 4 25:37

Just on my computer. So, so you kind of are just with this document. You're kind of trying to make sense of what we have and map it. You're not trying to propose a big change or anything like that,

Speaker 5 25:46

Not right here, actually. So when we just go down, I gave some recommendations. Okay, so basically not completely changing the map mapping that we have right now, but I

Speaker 4 25:59

Should have, which I had before I even spoke so much. My bad, I didn't know there was more. I'm updating a copy that's only on my computer. Okay. Want to update a copy, or do you want me to send you my copy?

Speaker 3 26:10

Sure, you can send me your copy. Yeah, the only thing I've done so far was I changed. This Dev1 is just called Dev. I didn't touch anything else is also just called QA. Yeah, yeah, but the uits are different. Yeah, I don't know why UT is u81, I don't know.

Why dang it? All right, q82, uh, T1, and 2 staging. Staging. So, this is where we're having a problem, right? Is it the life cycle class? A lot of times, you phrased it. The other day, Alex reader, said like we had four flavors through them.

Speaker 4 26:51

Yeah, so I mean there's there's Dev. And then there's non-dev non-prod, and then there's pre-pros. And there's prod. And I think it staging's a non-proud. So, um? Do we have, like, later on? Do you classify this life cycle class? Not really. We couldn't do that though.

Speaker 5 27:11

Yeah,

Speaker 3 27:12

Do you all care if I do?

Speaker 5 27:13

Sure, yeah, I think

Speaker 4 27:14

It's basically what I just said, right? I mean, it's like

Speaker 3 27:17

My brain likes when I can classify things. Like, if you just say, because it just pisses me off. But if you say, because and you follow that with a very solvent solution or. Statement. I'm, like, oh, get on board with that. But that would mean today. This is non-production.

Speaker 4 27:37

Yeah, and this is what we're like. Trying to figure out,

Speaker 3 27:42

I think we should.

Speaker 4 27:43

I honestly, so you guys have what two weeks right? Yeah, I think we need to, like, basically like explain the situation, so I need to read the rest of your document actually before it, because maybe you?

Speaker 5 27:56

If you have big plans to for redesigned, then maybe we do just slap it in ltuat and we move our stuff around later, but if you're it just depends, I need to read what you have, show it. Perf! It's pretty broad because production data. Good, what is npt? Does anybody know?

Speaker 3 28:21

Mike, but I don't know. In PT, I'm not sure, either, but I have seen that in the in that accounts, it

is. Let's go look. So, chances are I don't get it. I know that on the. Uh, SharePoint site physically accounts. Oh yeah.

Speaker 2 28:49

Because even if you don't have access, it just shows them all. So,

Speaker 4 28:53

I tried to update that a couple months ago, so it should be horrible, but I didn't like, I don't know. It's been a long time. I also let stuff that had what I thought was relatively adequate information. I didn't want to mess with because it was, like, in a very.

Systematic way. I think Danny did it, so I only touched stuff that I knew was actually wrong or empty. But some of it, I think, is a little confusing.

Speaker 3 29:22

I thought I had a link to it, but, um, so see how?

Speaker 4 29:35

That's what I'm looking at.

Speaker 2 29:39

Me and Danny were doing it the other day where there is a search button. And. Oh, fancy all.

Speaker 3 29:50

And here's everything. Help one tooling VR non-prod, one TF repository.

Didn't find either actually.

Speaker 4 30:06

I cannot find that too, but I think I have seen that somewhere. It probably is a typo, something. Maybe it was a typo someone meant to say mvt. It was a network Services.

Speaker 1 30:23

I got rid of it, MPT. I know that's production data.

Speaker 3 30:27

We don't have anything over anyway. Production is production, which is production, which is L2 production.

So, yeah, CD terraform State modules, or in the shared account.

Speaker 2 30:40

Yeah, is

Speaker 3 30:41

That a shared account L1? No, it's L1 tooling TF repository K from terraform modules or health super tool ATF? Network shared platform.

Do we even use this Dr? No. That's it! So, I don't know how Danny's going to feel that you gave him a partial list you gave me my answer. What I was worried about is like developer Showtimes, I want this, and then Alex goes. We can't accommodate me because we won't have stage.

I was trying to service that problem and get us to talk about it. Danny's pregnant on one very thorough? Holds together every direction you go, but so I think that, so we have an account standard,

Speaker 2 31:22

And I think that it, maybe, whatever we decide on here, it could be updated to like reinforce it and stuff, but I think that's a good place to give all the. Bureaucracy and stuff that we want. Yeah.

Speaker 3 31:36

Yeah, this one doesn't even claim to be an account standard. It's an AWS account to kfb environment, which is like a good reference material that can be quick and short, and so I don't know if we even need these down here at the bottom.

Speaker 2 31:50

Do we? I actually like, well, hold on, I guess. No, it's this is an account that's more of an account mapping than environment mapping, so you're right, I don't know. I like what he had. Yeah, it's all accurate, though at my point, I guess, but it's incomplete. Uh, yeah, yeah, but it's, I guess it's not within scoop per se, but I do that is all correct.

In my mind, everything you have there. So,

Speaker 1 32:09

Sometimes I'm

Speaker 3 32:09

Just prepping you off with the possible debates you're gonna have with people. So, if that comes

Speaker 2 32:14

Up as a problem. Zap all right, how about now? Okay, sounds good. We practiced that contingency. Moving on? Production data and non-production accounts perf and MPT use production data, but are hosted in non-production accounts.

Speaker 3 32:31

Good here, actually, are we?

Speaker 2 32:33

Yeah,

Speaker 3 32:34

It says, which does not mean standard.

Speaker 4 32:36

So, yeah, I've seen that in that standard, so I, but they, but they are not in non-production counts. They're in pre-production counts today.

Speaker 3 32:46

Teams production data, but are hosted in production accounts. So, this is just,

Speaker 4 32:49

Oh, that that's actually for the L1r. So, what I observed foot that I have wrote there. The staging, the non-production and purpose, actually changed that. Okay. We didn't change these, did we? No, but I think that's solution.

Speaker 5 33:06

It might have been because of like the classification system, but this is like, this is not true. In actuality, today, I'm really confident on that.

Speaker 1 33:15

I'm going to learn how to spell hallucinations in there later. Uh, is a hard one. I think there's two L's in the beginning and everything else is like normal.

Yeah, I think that's right. How about I'll leave you that note? That way, you can go like, I don't know what this 321 standard is. It's probably from the account standard. Yes, um.

Speaker 3 33:41

Staging perf and amputee share the same accounts, despite having different data sensitivity levels. I think that is a difference. What we're proposing right now is staging. Yeah, we just flipped that. So, I think we kind of just resolved that.

Speaker 2 33:55

At least to an extent we we picked. We, we decided to pass forward on how we will resolve it, whether we well I think so. Well, okay, maybe not.

Speaker 3 34:03

Which way are you going?

Speaker 2 34:04

I guess I keep saying that, like, we've read the whole document, but I think I think we need to tell this. Let's read the whole documents. I'm gonna stop highlighting it. I think you. You. All partners need to want to talk a little bit more.

Speaker 3 34:16

All right. L1 account names cause confusion, production pre-production, non-production at element counts, but their needs do not include the L1 prefix. This makes the relationship between L1 L2 accounts and clear,

Speaker 2 34:25

And that's we're not going to

Speaker 3 34:27

Fix it. You're just stating a problem. L1/L2 are not used consistently. L1 was intended for legacy or migrated applications. Well, too, is intended for cloud native applications. The original L2 requirements are no longer applied consistently. This is probably true. I would be careful of mentioning that because you're gonna, I would also be careful mentioning it, but it is probably.

Speaker 2 34:46

I mean, like, I think that we've done lots of things where, like, something could be argued, like, hey, we could push this for L2, it's more of an L2 type workload, and we don't do it. And then, arbitrarily, other times, we, well, it wasn't really arbitrary with real-time insurance, but we kind of were forced to from like a networking discussion perspective.

I think he's just. I think it's apt in saying that we don't do proper assessments every time when we create new workloads. And maybe we will do better going forward because we already like broke that friction with real time, and it's already a big discussion. We're thinking about it, but I mean, in the past, I think at least this is true.

In the current stat, I just don't know if you want to bring that up, maybe not. Yeah.

Speaker 3 35:28

Do you want me to keep wire lighting stuff, or you want me to just let you all go through this bottom section because rum is done? Yeah, almost yeah. Okay, let's just run through. I don't want to rewrite your whole document right now.

Account structure is not efficient. Was this is a really negative AI when you wrote this? Because this AI is so pissed off at you is not efficient, no control.

Speaker 2 35:53

Number four is a great point, though, I mean, it's like, you know, we, we're, we're consistent. Like, we put all the

Speaker 1 35:59

Pre-Prod or both, the pre-products together, and then QA and uit. They're the same, and we don't treat them as such. I guess it wouldn't make sense. Like, if you're trying to describe?

Speaker 3 36:09

Like, if development all the sudden says, well, we're going to put production data in QA2, and you all can't accommodate that because you always kind of commented that because that's against the rules. But let's say. Hang on. So, let's say.

Speaker 5 36:26

Gagwire. If I go in there and say,

Speaker 3 36:27

Make this uplifted and enhanced all of a sudden God words when I treat that thing as if it can in half production could probably ever do that.

Speaker 2 36:36

We're managers. We come up with crap all the time. Please just make a new environment, please? That's what I would say, don't do that. Please don't do that. All right.

Speaker 3 36:45

Alex. He has so much faith in this.

I mean, have we done that? I don't think. I, I don't know if we've done it in recent times. But in the past, when managers pretty much had their own little fiefdoms like this is mine, and today dig it in here and get out of here. Don't worry about it.

I would, hopefully. Wouldn't do that. I know on the Mainframe that would cause Lee to have. Be quite upset because on the Mainframe, they're completely structured differently. Yeah, she's also going to be upset. She's going to say the same thing you just said. Watch it now! I guess she just would have to say, damn it, that sucks, but I'll do it.

She can do it because that's what they've done for him. I think C was always production. Size M was always production size because I used to use M for my production support for claims there. C was always like a performance region for the policy team. Yeah,

Speaker 2 37:44

Okay, but the Mainframe reassignments I don't really know how that works and stuff. I know that they have long histories. Most of the environments,

Speaker 3 37:51

You know, it does make sense. I, I do think at the end of it. We should let Dan see this document, so he understands what capabilities. And honestly, I was also going to see if we can start throwing. Where did I put it? I hate M101 browser. The one

Speaker 2 38:06

Thing that's nice, I will say, as a counter to that point about QA and uat. Is where we're going to end up. Is is a? Environment maximum per L2 account, which keeps things I guess, not like really crowded, which I think there's something to be said for at least to an extent, but again, I mean, I don't know.

You don't want a bunch of arbitrary deficiencies either, but?

Speaker 3 38:29

I think from a programmer standpoint when a developer shows up and goes, I need this and depth to because I think they have come up and said, I need this in QA or I need this, and because they're going to be told by their manager that, uh, you know, I'm working on the mortgaging project and the mortgaging project is only allowed to show up in qa2.

So, I want Mike's stuff set up in QA, too. What account do you all set that up into? And then, if we change the rules on our side, saying, all right, damn it, we already? Crazy, and we're gonna put production date in QA one. Can you all accommodate that, or do you have to completely repurpose everything if we can put a column in here that says AWS account and then list AWS account.

Then everybody's gonna understand where this stuff needs to be requested or where you're going to create it unless you think I'm making too big of a deal. I mean, I think, I mean, honestly,

Speaker 2 39:25

I think that they, I think we should be. We should be the people that know the account mappings. Maybe Dan can know for his knowledge, but I don't think the average person should know because that's.

Speaker 4 39:34

There's only room for misinterpretation. By then, we know the mapping. They say, we want this environment of this application. We know that's an L2 app. We put L2 QA here, and that's where it goes. I mean, they're they're not going to have. They might need access to read it or whatever.

And maybe we could have somewhere, but I don't think, like, proactively advertising it. This is like, info that well let me challenge

Speaker 3 39:55

It. So I know I just created something in QA too. Uh, as let's type of thing, say, I just told you to create something the QA2. Yeah, I'm gonna go try to look at it, you know? I'm actually starting to get into the console. So, I'm a developer. I'm gonna figure out, oh man, I finally figured out where the console is.

Uh, which one of these accounts did it go into?

Speaker 2 40:16

But I think I think we should have a reference for that, but I don't think it necessarily needs to be advertised as just a base element of an environment. Like, because okay. Like, kavitha. Once, whatever it's called, like the database that you're whoever is making for it, right, USA.

Like, uh, if he comes, and she's like, I need this database in. The L2, whatever it doesn't matter. Whatever account just says, not production, she says. I need this in the non-production account. It that?

Speaker 1 41:18

That

Speaker 2 41:18

Determines where everything goes for that, right?

Speaker 1 41:21

That's why we have the application exactly. Find everything or any confusion, so we know which account is going.

Speaker 2 41:30

They go with a similar concept they don't. They don't have to pick the account, they have them give them information about what they need, and then they

Speaker 1 41:37

Manually. You all know to consult this page and know, oh, Dan has said, you can only put mortgage e in QA2. So I, I think we're going to run into problems from time.

Speaker 2 41:50

But okay, no, I

Speaker 1 41:50

Did not know about that because so,

Speaker 2 41:53

But this is. This is a developer's resource. This is the person who's requesting stuff to know this? This isn't this. Isn't the admin the admin? Does the mapping for account to account to environment and the developer knows the mapping of their project to an environment, but I think that.

Really like the two knowledges can be separate

Speaker 1 42:12

From one another. For the most part, I mean.

Speaker 2 42:14

Because I mean, she would never independently say, oh, I'm going to build this mortgage list in uat2. She would never do that. She would always get a request for that. You know, what I mean, like, I haven't really looked into the form that she filled up, but I know she did for the house.

Yeah, um. I think it would.

Speaker 1 42:31

For on her to know that to know to let us know and also leave the section there that says, okay, just specify that the environment you need this in. Yeah, and like, kind of workload, you're going to put it. So, she might say she's going to put, um. Production.

Dante in in QA2 enable color and only can't do that. Okay?

Speaker 3 42:54

I'm playing some exercises because I, I think right now, we just don't have a lot of people having to do this stuff. But,

Speaker 2 43:01

Uh, I don't know. I'm being potential. I think

Speaker 4 43:02

Someday we probably do want to put a column in here that says AWS account well, but then you need two columns.

Speaker 2 43:11

There's not one account per environment. It's L2 and L1, unit L1 and L2 column. And if you want to put that in there and trust that people aren't going to be like, what does this mean then? We're

never doing L1 again. It will probably do L3 if that.

Speaker 1 43:26

I mean, if that's that's written in our plans for the cloud, so if you don't want to do that, you should start pushing back now.

Speaker 2 43:34

I don't, I don't. I mean, nobody's even made anything, so I'm taking this way off task. I think we were good, though, right? Uh, yeah.

Speaker 1 43:45

Make sure that the stuff makes sense. I'm I was mostly after this up here. Do we have an understand,

Speaker 3 43:51

But I just want to make sure you would. So, what do you say at the bottom like, are you proposing anything so basically, not much, uh? Some recommendations that I would. Expected change so? Completely about mapping, but?

Speaker 4 44:06

Few things, but like, largely like L2 structure. You're not proposing a massive shift in, and no, actually, I did. I'm not. So, would you agree that?

Speaker 2 44:17

Okay, so we have two weeks right for real-time staging. I think at this point we have two options we either. I didn't see that

Speaker 3 44:25

Sorry. Reading the L1 accounts to L1 production l1p product L1 non-prod create a formal exception for production data stored in pre-prod LT pre-prod. Identify accounts containing production data as apply security levels. Clear defined production use production data and standard.

Uh. So, I mean.

Speaker 2 44:52

We have two weeks. That's not a long time, obviously, and whatever account we probably are going to use does not have networks. And we'll need to set that up. And there's there's probably going to be more stuff than we're thinking about right now. So, like time is of the essence like we should, probably, I think.

Give the csgrt an ultimatum and say we need this staging environment in the next week, we are going to start building it in the count in the next week and. If you guys make us, we're gonna put it in L2 uat. If you let us, we're going to make L2 staging and this is happening within the next few days, and we're going to go

Speaker 3 45:24

Down

Speaker 2 45:24

One of these paths. And I don't know the exact date of that ultimate, but I think we have to do that. Yeah, I'd say you want to start building this staging on the eighth.

Speaker 1 45:34

Because you don't need it. This week, I would say we

Speaker 2 45:36

Should start building it. Like, this week, if we can, or at least like the making like, I need to go. Make sure we have networks and stuff, and I want to know if we need Network. So, where we need networks ASAP, you're a calling effect. My heart is not being that low and long time.

That's good. Usually, it's like 100 because I had high blood pressure good, good, good.

Um. Whoever, whatever package you think that that should go to the cshtt, and if you want me to like message, Mike and Danny, that's what I usually do when I communicate with that team, but I

Speaker 1 46:11

Don't want to get in your way, and I don't want to be a middleman because I'm still you know where I would go. I would tell you just to put it wherever you put it right now with least amount of resistance, because time is of the essence. But if you want to give it a shot.

Speaker 2 46:24

It's just the third resistance either way. Like, I still need to go to Matt and like get with them on the trans Gateway stuff and like, we know exactly how to do it, but I need to be like, hey, here's my PR. Just making sure you I need to get like a network range from him because he's like he has like the.

Pipam Excel sheet. Basically, even if

Speaker 1 46:42

You're just putting it in an existing account, or you're saying yeah, because the networks don't exist in those existing accounts, uh?

Speaker 2 46:49

They're just accounts, so we've

Speaker 1 46:50

Never put anything into QA or uat. Correct

Speaker 2 46:53

The only L2 accounts that have ever been used before real time were l2dev and L2 Pro. Dang,

Speaker 1 46:58

It was a Lambda that JVS did that went straight to prod. Yeah, there's networks in Prague, because JBS did that, uh? All right. Yeah, it sounds like the old.

Speaker 4 47:11

It's not a big deal. It's not as big of a deal as it sounds, it's just

Speaker 1 47:14

I just I'm anticipating pushback and slow down. And then, yeah,

Speaker 4 47:17

Yeah, it takes. It always takes time, like the if your perf took so long to set up. It shouldn't have, but I mean, in most of those issues, we will remember and get right right away, but some of them will still take time, and I build staging in front at the same time.

Yeah, that's a great idea. We all do that I.

That way, you can't forget something.

Speaker 3 47:41

You got two weeks before it's gonna be live. So, whatever you need to get it done, let me know what you need.

Speaker 1 47:49

I like the document, though I think it's good, especially the mapping part. It's good to have something like that. I'll send you what I've got. I didn't make too many changes. Yeah. If you're going to walk in and show that off? I would just be prepared.

And do you want me to suggest anything else for the mapping? For El Tor L1. Um, like it sounds like he is gonna push for One Direction. Okay.

Speaker 3 48:20

Uh, let me pull it back up, sure. There you go.

Speaker 1 48:25

Got the right side. Just check I would proponent thrill 2 staging, uh?

Speaker 2 48:30

I think we should do that, I think, yes, I'm cool with. I think we'd be fine putting in multi-uat. The world wouldn't come crashing down, but I think that we should present those two options say we prefer staging. We'll do it this way if you make this. Cuz this is the way you're going.

Yeah. And I did change some of these other values. I think it would help to have. Like, a category that explains this table.

Speaker 4 48:56

I, I also am a little bit unclear on what actual jurisdictions csqt really has over account structure. They won't, but you.

Speaker 1 49:05

That's where my second question to you was, who do you need to buy in and you did say csqt?

Well, because

Speaker 4 49:10

I think that that generally like these these. I think this is the kind of thing they expect to be consulted on and whether or not that's appropriate. I think that that's fair enough.

Speaker 1 49:22

I think it is helpful to let people know when you're going to do something that way they can contest it. Otherwise, you find out later that they want to tear it all down, so they have a whole workflow about how do you need an account? Do you need a new account for this, or does it fit in a whole a current account?

Like, if you were to just ask for a new account from them, they're going to like, push back, be, like, ah. You don't just get one because you asked for one.

Speaker 2 49:46

Because I remember I part of that team. And the fights and the arguments that went on for weeks and months over account. It's a very sore subject. It taxes.

Speaker 1 49:57

Let's do

Speaker 3 49:57

Micro

Speaker 1 49:58

Accounts? Yeah,

Speaker 3 49:59

Oh man, that would just throw a whole range.

Speaker 1 50:01

I mean, I think I think that's what L3 would be like, we're never going to have an L3 labeled account because I think an L3 account would be. Payment immigration QA, you know what I mean? Like, uh, Jackson called it level four.

Speaker 5 50:15

So, I mean, whatever you, whatever you only call it, I think that's like. That is, like, the actual most modern account structure is down to the team down the application down the environment. Like, I mean, the micro segmentation of accounts is because it's like, it's like the way you guarantee like everything here will be classified into the right bucket.

We can't associate every cost. We can put hard shot, shut off like, money shutoffs on, like all of this stuff, the exact way we want. It's like, I mean, you can do everything like, you have the maximum amount of power you can say if. Like, if payment integration QA spends too much this month, shut the whole thing down, and it's like in a blast radius to the point where you can do stuff like that.

It's hard to do without accounts honestly, like extreme stuff like that it's. That's what that gives you.

Speaker 1 51:00

Whether

Speaker 3 51:01

You know who's spending the money,

Speaker 4 51:02

Which we we should know who's spending the money anyway. But, but it's like it adds like capabilities to take it further, I think as well. And it also leaves less room for air when you. Do it that way.

Speaker 3 51:15

Well,

Speaker 1 51:15

I'll let management know when we have this discussion so they can help push it through, but I think you inside probably want to communicate to the teams? Hey, we're working. Ask in. A very rapid succession. Can we get staging L2 staging going? And here's a reason why. Whatever you think is going to be best received.

I.t

Speaker 5 51:36

Security in the map, or like the two like csqt, I.T security, and Matt are like the people like we would need like work slash buy-in from. Uh, we don't need like a lot of work from anybody, though it's it. We're asking them for something small. They'll be able to do it quick.

So, it sounds like British is able to load data, but because we did not buy.

Speaker 1 52:02

Within the stage.

Speaker 7 52:04

Sorry, I'm changing top exactly what she heard.

Speaker 1 52:06

The current day stage version does not have Cloud related connectors, so performance is slow. We are working on other options by using python or glue. A little late in the game to do that, but As long as the data gets there eventually, I don't care. I mean.

Speaker 2 52:24

We just have to have it up and running so they can call it. No one said we had to give them

Speaker 4 52:28

Data, right?

Speaker 2 52:30

Nope, they don't have insurance with us. We couldn't buy any record of that person. Sorry, I keep hearing like the reason. It's not like.

Speaker 7 52:38

Do or

Speaker 1 52:39

Die is because there already is some companies that aren't going to meet the October 1st, and they can give us an extension.

Speaker 3 52:45

Okay,

Speaker 1 52:45

So, uh, but I'm not in the know of who asked for that extension order as long as we're continuing to do the whole process. They're probably going to expect.

Speaker 3 52:54

Yeah, I'm making

Speaker 9 52:56

All kinds of excuses to explain why this is all. Okay, that we're waiting to the last minute to yeah, comply with regulations,

Speaker 1 53:02

Regulatory reasons, but?

No good. Sure.

Speaker 4 53:23

Like all.

Speaker 2 53:53

Of all future deployments, like starting now to go in there already or anything, but also what

Speaker 1 53:59

If you want to try

Speaker 2 53:59

If you want to try one? Absolutely. Um, all customers are welcome. I okay, the one thing I'll say is the module that I have created in. There is for web apps, so all that means is, it goes, it goes ahead and goes ahead and creates all the kfb environments as environments, and then puts the environment protection rules on prod.

Um, so like, for example, if it's like a utility project, it doesn't need that, and I, I was going to make it separate.

Speaker 1 54:26

Two of these three are going to be utility, so

Speaker 2 54:30

I'll make a separate module. It's going to be like fairly different and obviously like 99 of, like all the annoying stuff we work through, is like it, will it? We're good, uh. But basically, I don't. I don't even know exactly what it'll be, but like if there's like, uh, packages setting or whatever that we need to check on those, we'll make sure to get that and.

Um, you said, like, conversion? There's a version. Yeah, there's that variable. Um, and then I want to make a terraform, one which will look very similar except. Basically. I think what we're going to end up doing is most terraform repos are going to end up having a prod and a non-prod environment because we're going to protect everything except prod the exact same way because of the way that terraform assumors work.

We can do that pretty easily.

Speaker 1 55:15

Um. It's like. There will be at least three modules, or yeah, three repo modules that do slightly different things, but 99, they will be identical. And, like, it's just creating a repo. We might have like a different readme template for the terraform. Well, I think

Speaker 2 55:32

At some point we agree to, like, well, so we had a pull request template that we kind of piloted when we agree that we want that and every repo. This will be a piece, and then when we turn on dependabot and all those settings. There's having you set those and put the dependable yaml file.

Yes, in the wreath of oh, okay.

Speaker 1 55:56

That's, that is definitely something we can do arms 2.0. That's what it's called. I was wondering why you're right? And she gone and saying.

Speaker 3 56:10

So is it arms?

Speaker 2 56:11

I am going to name the repo arms t-w-o p-o-i-n-t z-e-r-o.

Speaker 9 56:24

We've changed, we.

Speaker 2 56:30

Going to do that,

Speaker 5 56:30

But this really showed me what Barbara Jay's like, and I was like that.

Speaker 2 56:36

I came back into two videos. That's what.

Speaker 1 56:38

That's what the Derrick on Wednesday two points.

Speaker 2 56:42

Yeah, so like us being you. Yeah, you do it. He made me do work. He was terrible, Amanda. Seeing this issue in arms to QA2.

Speaker 1 56:58

Someone. Can someone please check this issue? I'm seeing arms too. QA2, I can see the messages now. Oh no, I thought you were. Did I thought about that?

Speaker 4 57:09

I'm that's, that's a valid thing. Have we thought through all the I liked parties, go back and rename the database? Are we going to go back and rename the repos that have already created party 360. Is that what we needed? We've got KMB CRM. Front end for the?

Speaker 3 57:37

Like, how would your company's name products?

Speaker 1 57:40

Total arms right now. It's nobody knows really what it means, but it does kind of make sense. Agency account

Speaker 3 57:46

Relationship management system. Yeah, okay,

Speaker 4 57:49

It's. I've seen one of the purple octopus

Speaker 3 57:52

Go look inside V's desk. Okay, it tells you it's holding all these little. It holds all the little things. I guess that was before CRM. That was the.

Yeah, that's what r stands for. I think I knew that actually at one point. Push both arms right now. What would you call a new reason? In what? Like they're building, they're rebuilding arms, they're refactoring it, and everything. Insane application in this company.

Yeah, I think they should be farm-based to farmhouse barn house. Because I don't know enough. Hearth I learned hearth is the same thing as Focus. I mean, we don't even have to

Speaker 2 58:44

Be creative CRM about kfp.one. What's wrong CRM Center? There you go, then you find out that you're supposed to go into the CRM to enter

Speaker 3 58:53

Commission bank accounts for agents, you're going to be okay with that, because that's what they freaking do with arms. Apparently, yeah, this is our CRM. That's what I'll say, because that's what we did. Ours is everything it does everything. We never gave you a chance. I didn't answer us.

Which is the name I'm after. The brands like this is a sales force, but we want to spell one of those alert words. We don't get to Saul was fort.

Did somebody call it the web 3.0 spelling of things where you just like drop letters like tool called remove the vowels or something? Everything else is taken. All the domains are taken.

It's like, now, what do I do? Do I go and have everything renamed?

Speaker 1 59:47

Database was named, but ar.
